

eHealth Planning and Management Symposium 2008

# The EHR and Clinical Archetypes: time for clinical engagement!

**Dr Dipak Kalra and Dr Archana Tapuria**

Centre for Health Informatics and Multiprofessional Education  
(CHIME)

University College London

[d.kalra@chime.ucl.ac.uk](mailto:d.kalra@chime.ucl.ac.uk), [a.tapuria@ucl.ac.uk](mailto:a.tapuria@ucl.ac.uk)

# What is an Electronic Health Record?

---

“A repository of information regarding the health status of a subject of care in computer processable form, stored and transmitted securely, and accessible by multiple authorised users.

It has a standardised or commonly agreed logical information model which is independent of EHR systems.

Its primary purpose is the support of continuing, efficient and quality integrated health care and it contains information which is retrospective, concurrent, and prospective.”

Schloeffel P, Editor. Electronic Health Record Definition, Scope and Context. ISO/TR 20514. International Organisation for Standardisation, Geneva, 2005

# What problems does it help us solve?

---

- Manage increasingly complex clinical care
- Connect multiple locations of care delivery
- Support team-based shared care
- Deliver evidence-based health care
- Improve safety
  - reduce errors and inequalities
  - reduce duplication and delay
- Improve cost effectiveness of health services
- Manage health care resources more effectively
- Underpin population health and research
- Empower and involve citizens
- Protect patient privacy

# Where is EHR information needed?

---

Citizen in the  
community

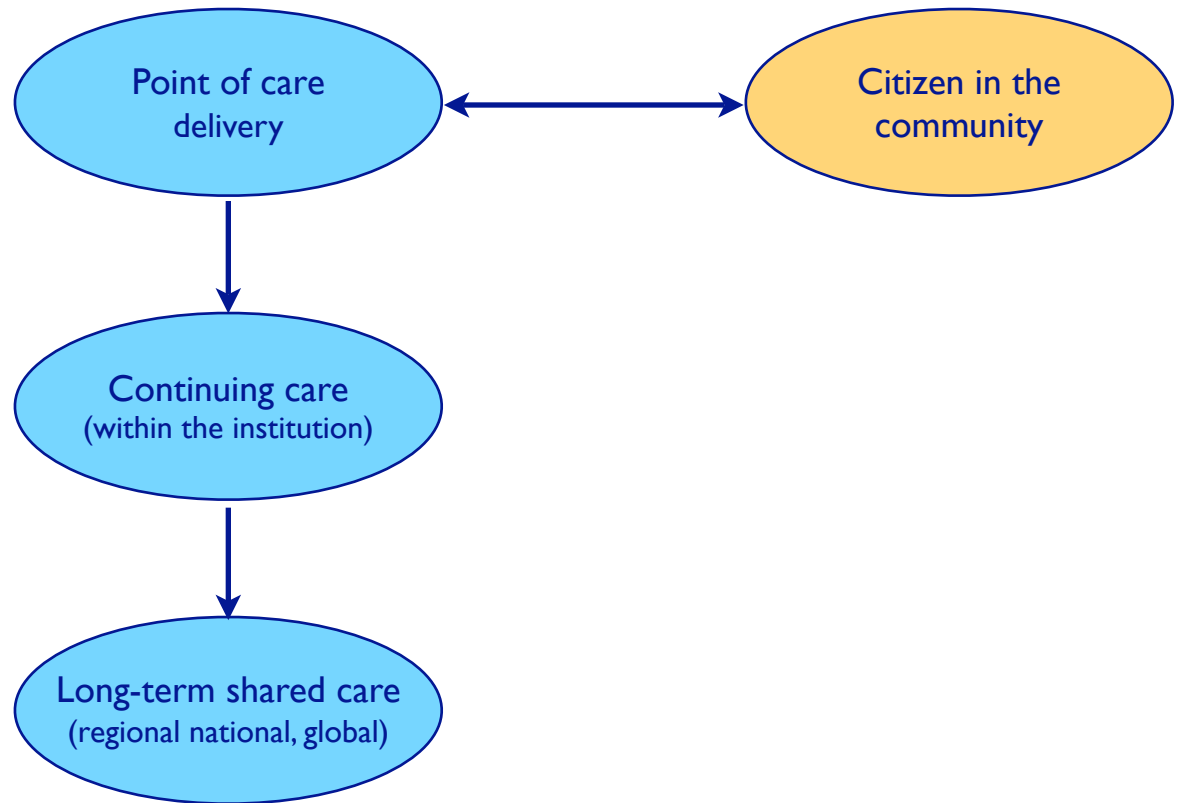

# Where is EHR information needed?

## Requirements for an Electronic Health Record Reference Architecture

### Warning

This document is not an ISO International Standard. It is distributed for review and comment. It is subject to change without notice and may not be referred to as an International Standard.

Recipients of this document are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Document type: Technical Specification  
Document subtype:  
Document stage: Final Draft  
Document language: E

# Requirements the EHR must meet: ISO 18308

ISO/TS 18308

## 4 EHR ARCHITECTURAL REQUIREMENTS .....

### 4.1 BUSINESS REQUIREMENTS .....

4.1.1 *Health system requirements* .....

4.1.2 *Clinical practice requirements* .....

4.1.3 *Citizen inclusion requirements* .....

### 4.2 REQUIREMENTS FOR THE REPRESENTATION OF CLINICAL INFORMATION .....

4.2.1 *Kinds of health record entries* .....

4.2.2 *Structure of health record entries* .....

4.2.3 *The representation of context within health record entries* .....

4.2.4 *Intra-record links* .....

4.2.5 *The representation of data values within health record entries* .....

4.2.6 *EHR data retrieval and views* .....

4.2.7 *Representation and support of clinical process and workflow* .....

### 4.3 COMMUNICATION AND INTEROPERABILITY REQUIREMENTS .....

### 4.4 ETHICAL AND LEGAL REQUIREMENTS .....

4.4.1 *Support for legal requirements* .....

4.4.2 *Subject of care* .....

4.4.3 *Identification and authentication* .....

4.4.4 *Health care locations* .....

4.4.5 *Dates and times* .....

4.4.6 *Version management* .....

### 4.5 CONFIDENTIALITY REQUIREMENTS .....

3.40.1 *Subject access* .....

3.40.2 *Access policies* .....

3.40.3 *Policy over-ride* .....

3.40.4 *Audit trails* .....

3.40.5 *Consents* .....

Requirements for an Electronic Health Record

This document is not an ISO International Standard without notice and may not be referred to as an International Standard.  
Recipients of this document are invited to submit, with their comments, any relevant additional information that may be of use in the preparation of future standards.

ISO/TR 20514: “...Logical information  
model independent of EHR systems...”

---

# ISO/TR 20514: “...Logical information model independent of EHR systems...”

---

- **ISO/EN 13606**

- The simplest possible EHR reference model that still meets all of the requirements
- It is ideally suited for interoperability between heterogeneous and legacy systems
- It is the world-wide EHR communications standard

# ISO/TR 20514: “...Logical information model independent of EHR systems...”

- ISO/EN 13606

- The simplest possible EHR reference model that still meets all of the requirements
- It is ideally suited for interoperability between heterogeneous and legacy systems
- It is the world-wide EHR communications standard

- *openEHR*

- The richest available EHR architecture, and is ideally suited for building a comprehensive EHR system
- It is an open specification, technically validated
- It conform to ISO/EN 13606 and extends it for maximum completeness

# ISO/TR 20514: “...Logical information model independent of EHR systems...”

- ISO/EN 13606
  - The simplest possible EHR reference model that still meets all of the requirements
  - It is ideally suited for interoperability between heterogeneous and legacy systems
  - It is the world-wide EHR communications standard
- *openEHR*
  - The richest available EHR architecture, and is ideally suited for building a comprehensive EHR system
  - It is an open specification, technically validated
  - It conform to ISO/EN 13606 and extends it for maximum completeness
- Both are based on the use of archetypes

# ISO/TR 20514: “...Logical information model independent of EHR systems...”

- ISO/EN 13606

- The simplest possible EHR reference model that still meets all of the requirements
- It is ideally suited for interoperability between heterogeneous and legacy systems
- It is the world-wide EHR communications standard

- *openEHR*

- The richest available EHR architecture, and is ideally suited for building a comprehensive EHR system
- It is an open specification, technically validated
- It conform to ISO/EN 13606 and extends it for maximum completeness

- Both are based on the use of archetypes

- Both are now being implemented and used across the world

# Core properties of the logical EHR model

---

- the compositional record hierarchy e.g. the document level, folders and the structure of finer grained entries
- the representation of persons, such as the record subject, authorship, signatures and the information provider
- the definition of dates and times, both real world times when events occurred and the time-stamping of when details were recorded
- instance identifiers and version management properties
- data types to represent coded terms, quantities, dates and times, images etc. consistently
- a role based access control approach, with options for jurisdictional profiles of these

# Core properties of the logical EHR model

---

- the compositional record hierarchy e.g. the document level, folders and the structure of finer grained entries
- the representation of persons, such as the record subject, authorship, signatures and the information provider
- the definition of dates and times, both real world times when events occurred and the time-stamping of when details were recorded
- instance identifiers and version management properties
- data types to represent coded terms, quantities, dates and times, images etc. consistently
- a role based access control approach, with options for jurisdictional profiles of these

but, deliberately, no clinical domain knowledge

# Goals for EHR semantic interoperability

---

- To support patient safety, quality of care, chronic disease management, extended home-care, patient empowerment
  - enable the safe, meaningful sharing and combining of health record data between heterogeneous systems and actors / care providers
  - enable the integration and safe use of computerised protocols, alerts and care pathways by EHR systems
  - link EHR data to explanatory and educational materials to support patient and family engagement and professional development
  - ensure the necessary data quality and consistency to enable meaningful and reliable use of longitudinal and heterogeneous data for public health, research, health service management

# Goals for EHR semantic interoperability

- To support patient safety, quality of care, chronic disease management, extended home-care, patient empowerment
  - enable the safe, meaningful sharing and combining of health record data between heterogeneous systems and actors / care providers
  - enable the integration and safe use of computerised protocols, alerts and care pathways by EHR systems
  - link EHR data to explanatory and educational materials to support patient and family engagement and professional development
  - ensure the necessary data quality and consistency to enable meaningful and reliable use of longitudinal and heterogeneous data for public health, research, health service management

Clinical meaning (data, information, knowledge)  
must be capable of being represented consistently

# What is a clinical archetype?

---

# What is a clinical archetype?

---

- a clinical archetype is an agreed, formal and interoperable specification  
for representing a given clinical entity such as a clinical observation, a finding, a plan or a treatment  
within an electronic health record
- invented and maintained by *openEHR*
- ratified by CEN: EN 13606 Part 2
- being balloted by ISO
- to be quality labelled by EuroRec

# What value do archetypes add?

---

- A user friendly means to capture and collate professional consensus on how clinical data should be represented
- A formal model of clinical domain concepts
  - e.g. “blood pressure”, “discharge summary”, “fundoscopy”
- Can be published and shared within a clinical community, or globally
- Can be imported by vendors into EHR system data dictionaries
- Defines a systematic EHR target for queries and for decision support

# How could we make a clinical archetype?

---

- Option 1: start from common clinical examples

**Archetype for clinical concept:**

**Pain (symptom)**

## Examples of Pain Symptoms

- 40 year old female complains of intermittent dull pain in lower abdomen since the last 3 weeks.
- Severe pain in the upper abdomen for five days. Epigastric location, burning in nature, especially occurs at night, in bed.

## Examples of Pain Symptoms

**Now, lets add the terms for “character of pain”**

**Now, lets add the terms for “character of pain”**

Aching

Burning

Colicky

Cramping

Crushing

Deep

Diffuse

Dull

Gnawing

Heavy

Sharp

Shooting

Stabbing

Throbbing

## Now, lets add the terms for “character of pain”

Aching  
Burning  
Colicky  
Cramping  
Crushing  
Deep  
Diffuse  
Dull  
Gnawing  
Heavy  
Sharp  
Shooting  
Stabbing  
Throbbing

For consistency,  
these terms should  
be drawn from a  
terminology, such  
as SNOMED CT

Description Term	Fully Specified Concept	Hierarchy

# How could we make a clinical archetype?

---

- Option 1: start from common clinical examples
- Option 2: clinical brainstorming and many, comprehensive, examples

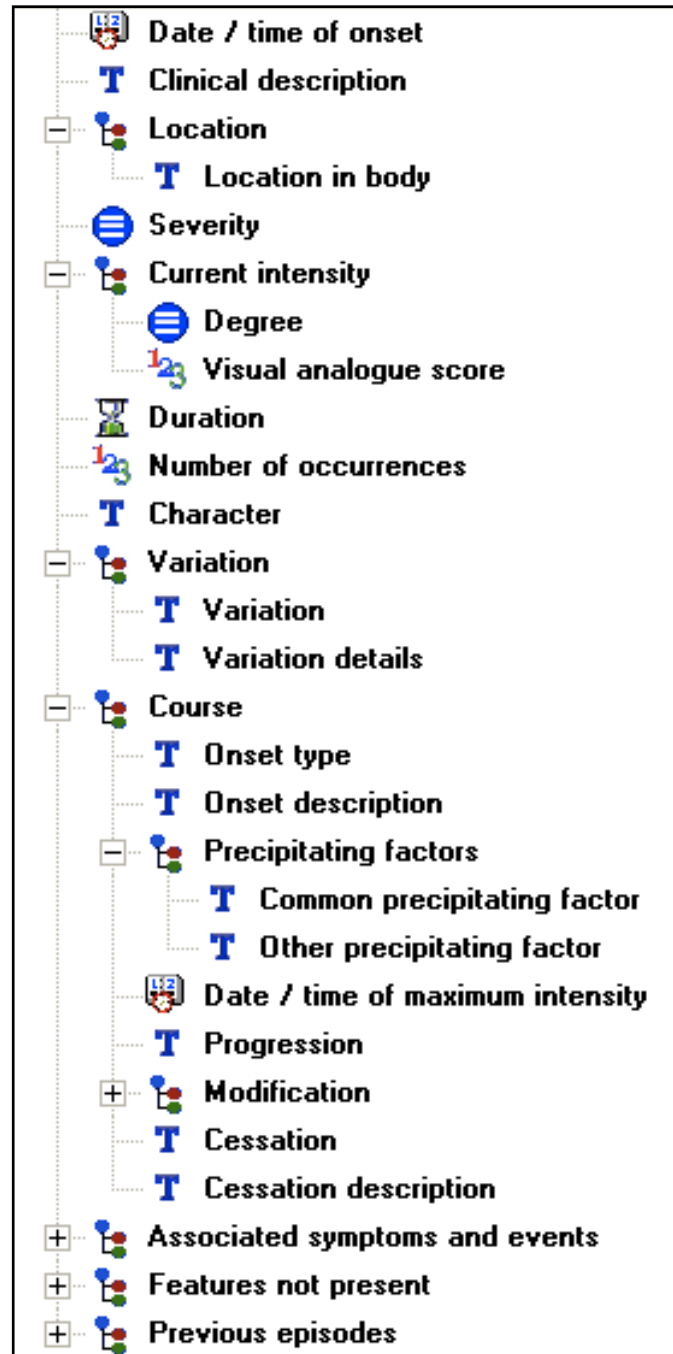

## Example of a complex symptom

- 56 year old woman, one week prior to admission noticed the **abrupt onset** of **chest pain** which she describes as **dull** and **aching** in character. The pain **began in the left para-sternal area** and **radiated up** to her neck.

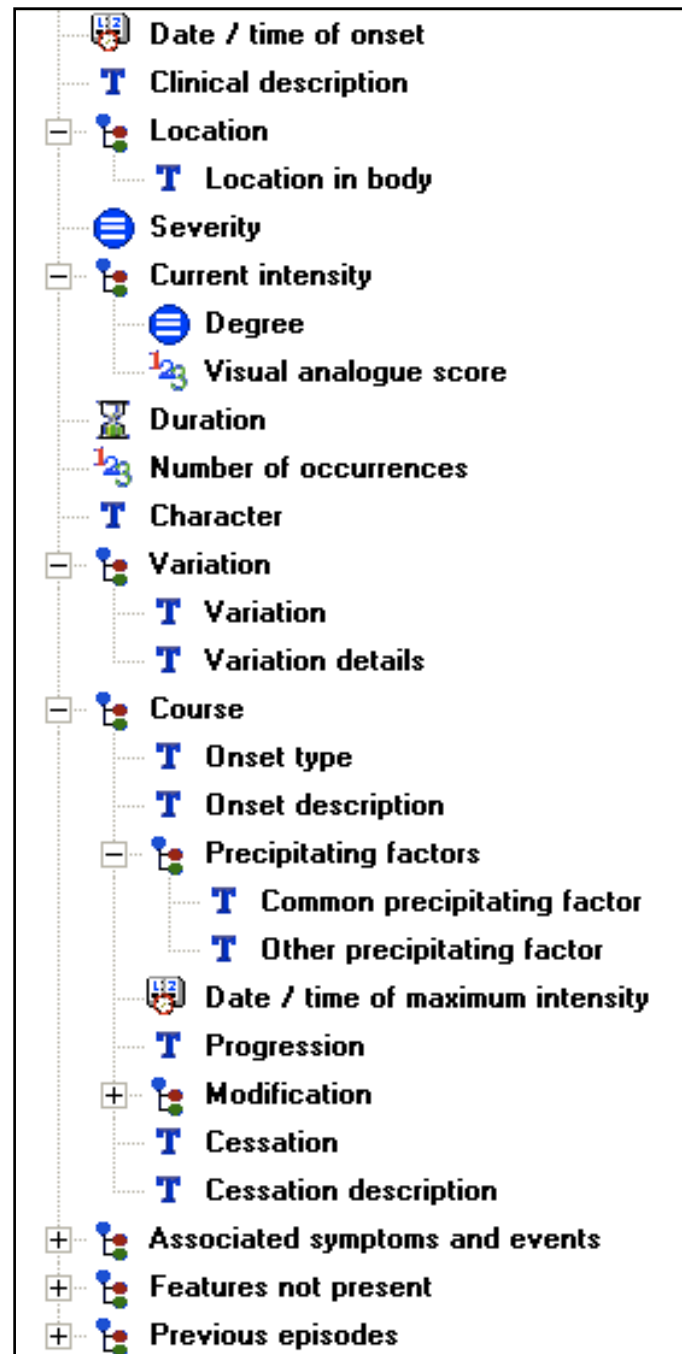

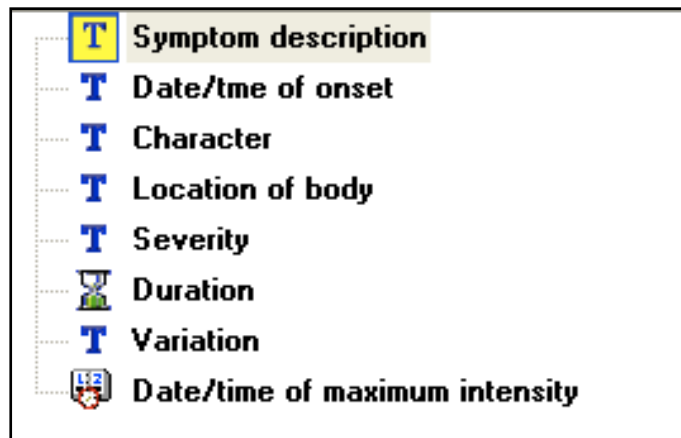

Her discomfort was **accompanied by shortness of breath**, but had **no associated symptoms** like sweating, nausea, or vomiting. The pain **lasted approximately 5 to 10 minutes**. She has had one **additional episode** of pain 3 days back, similar in quality and location to the first onset episode.

No change in the pain with movement, **no association with** food, no palpable pain.

# Detailed symptom archetype: *openEHR.org*

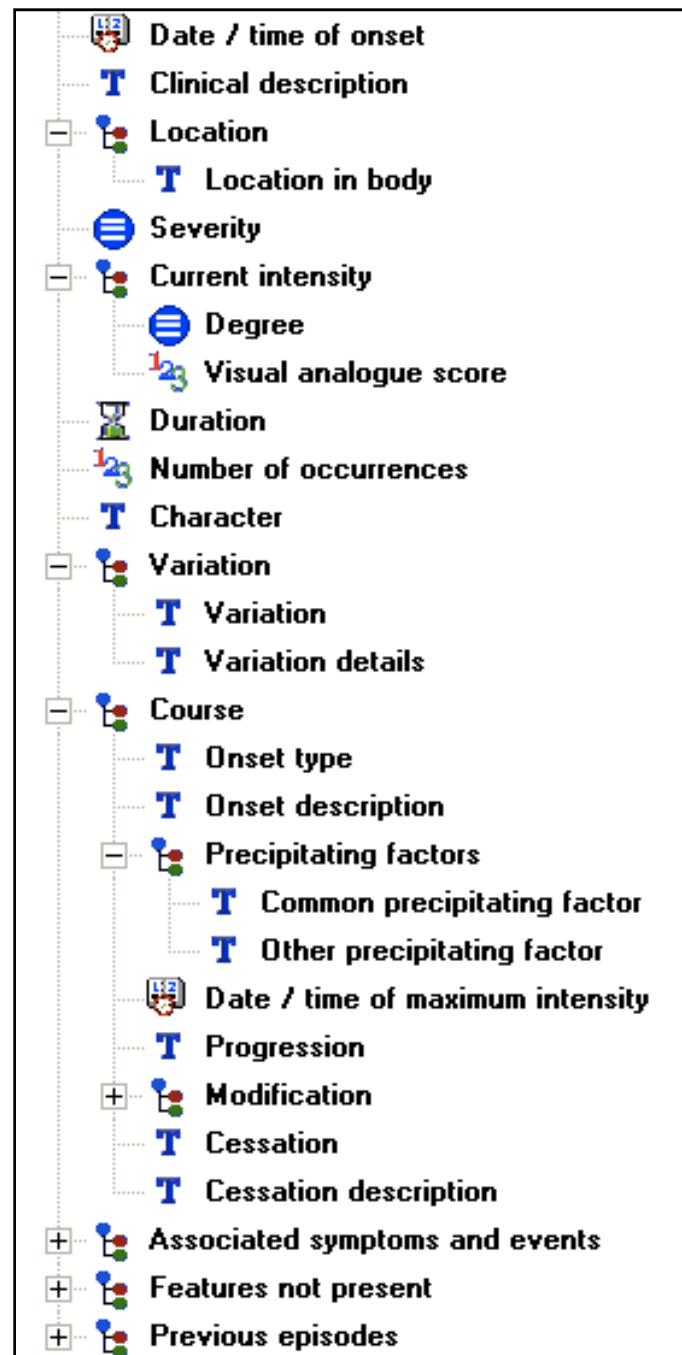

# Too small or too big?

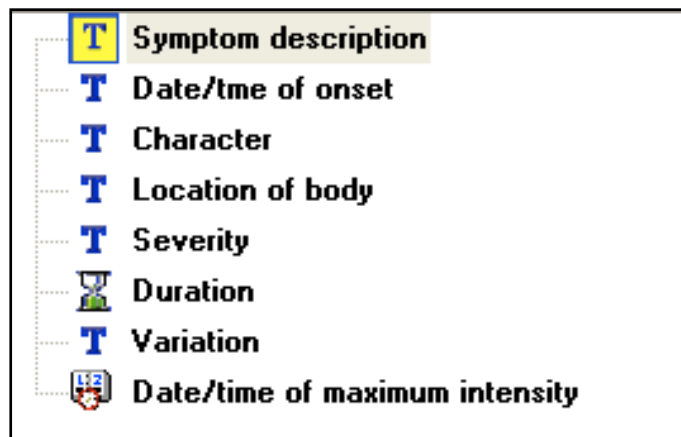

# Too small or too big?

How many examples do we  
need to consider before the  
archetype is  
**COMPLETE ENOUGH?**

# Too small or too big?

How many examples do we  
need to consider before the  
archetype is  
**COMPLETE ENOUGH?**

How much of a pain  
description is  
**USEFUL** to  
**SYSTEMATISE?**

# How could we make a clinical archetype?

---

- Option 1: start from common clinical examples
- Option 2: clinical brainstorming and many, comprehensive, examples
- **Option 3: start from priority use cases**
  - identify what most needs to be captured and shared to improve quality and safety

# Recommended priority use cases: for safe shared care

- New medication prescriptions
  - requiring comprehensive information on concurrent medication and details of known allergies and conditions (not simple ETP)
- Reminders and prompts
  - for overdue or overlooked health care actions and interventions
- Evidence based care
  - the use of clinical guidelines and other forms of evidence to determine the optimal management strategy and care pathway for a given patient
- Care transfers
  - referrals and within-team workflow such as the degree of urgency and the expectations of the referring clinician from another team member
- Care co-ordination
  - ensuring that a high-level view can be taken of distributed (multi-team) care to protect against duplication, delay and incompatible interventions
- Medical summaries
- Personal Health Records

# Example: diabetes mellitus

---

- High cost and increasingly prevalent condition
- Evidence of improved outcomes and lower costs if control is well managed and complications detected early
- Benefits from multi-professional input
- Care usually managed by many actors on different sites
- Information often not shared well between teams, resulting in inefficient care and gaps
- Good consensus (internationally) on the key indicators of clinical quality and patient risk
- Good consensus (internationally) on the data sets needed to monitor care

# Diabetes in the UK (Source: NHS)

---

- 1.8m people in the UK are diagnosed with diabetes
- Predicted to grow to more than 2.5m by 2010
- Diabetes accounts for an estimated 5% of all NHS expenditure
- Diabetes Continuing Care Reference data set published by NHS, being used to direct systems used to manage diabetes reviews and screenings

# NHS Diabetes Continuing Care Reference data set

---

Demographics

Diabetes diagnosis background

Risk factors and lifestyle risk factors

Current vital signs, weight, BMI

Blood measurements: glucose, HbA1c, Lipids etc.

Urine measurements: protein etc.

Cardiovascular conditions and complications

Cardiovascular risk scores

Eye examination: visual acuity, retinal screening

Foot examination: colour, skin, pulses, vibration, sensation, deformity

Renal failure assessments

Sexual health

Psychological health

Medication

Non-drug therapy

Lifestyle and wellness management

# Archetypes need to be quality assured

- It is important that the design of individual archetypes is an accurate and faithful reflection of good practice for the clinical disciplines in which each of them might be used
- The *openEHR* Foundation is partnering the EuroRec Institute in developing
  - **good practice for archetype development**
  - **quality criteria** and editorial policies by which certified libraries of EHR Archetypes can be recognised
  - The first major analysis of archetype quality criteria and potential certification approaches was published in Q-REC Deliverable 3.3 (July 2008)

# Archetype development check-points

---

- Identify a priority clinical use case for shared EHRs
- Identify key stakeholders
- Define the patient journey
- Identify shared care quality and safety needs
- Assemble the evidence
  - especially pre-agreed data sets, established consensus
- Define the archetypes, and bind to terminology
  - collaborate with openEHR Archetype Editorial Group & IHTSDO
- Validate with diverse but realistic examples
- Publish for peer review
  - specifically target key bodies to undertake the review
- Engage vendors to validate implementability
- Seek a EuroRec quality label

# Getting clinical engagement right

---

# Getting clinical engagement right

---

- Solve real clinical information gaps
  - join up virtual teams to improve safety and shared care
  - define the benefits right at the start

# Getting clinical engagement right

---

- Solve real clinical information gaps
  - join up virtual teams to improve safety and shared care
  - define the benefits right at the start
- Develop archetypes with multi-professional input

# Getting clinical engagement right

---

- Solve real clinical information gaps
  - join up virtual teams to improve safety and shared care
  - define the benefits right at the start
- Develop archetypes with multi-professional input
- Use available evidence and consensus practice

# Getting clinical engagement right

---

- Solve real clinical information gaps
  - join up virtual teams to improve safety and shared care
  - define the benefits right at the start
- Develop archetypes with multi-professional input
- Use available evidence and consensus practice
- Balance aspiration and coal-face practicality

# Getting clinical engagement right

---

- Solve real clinical information gaps
  - join up virtual teams to improve safety and shared care
  - define the benefits right at the start
- Develop archetypes with multi-professional input
- Use available evidence and consensus practice
- Balance aspiration and coal-face practicality
- No need to structure everything
  - start by codifying the data that can be computationally exploited
  - narrative is good for human to human communication
